

# IR

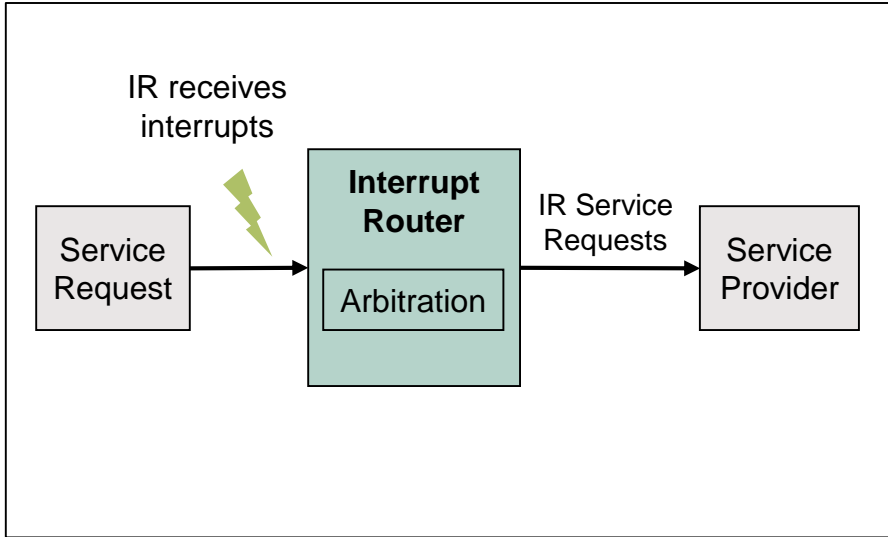

## Interrupt Router

AURIX™ TC2xx Microcontroller Training  
V1.0 2019-03

# IR

## Interrupt Router

## Highlights

- > Schedules the Service Requests (SRs) from external resources, internal resources and Software to the CPU and the DMA module (Service Providers).
- > SR cleared automatically on HW acknowledge by Interrupt Service Providers (ISP)
- > Software Interrupts: 8 SW Service Requests per CPU
- > Low latency arbitration around 50 ns

## Key Features

Mapping Service Requests to Service Providers

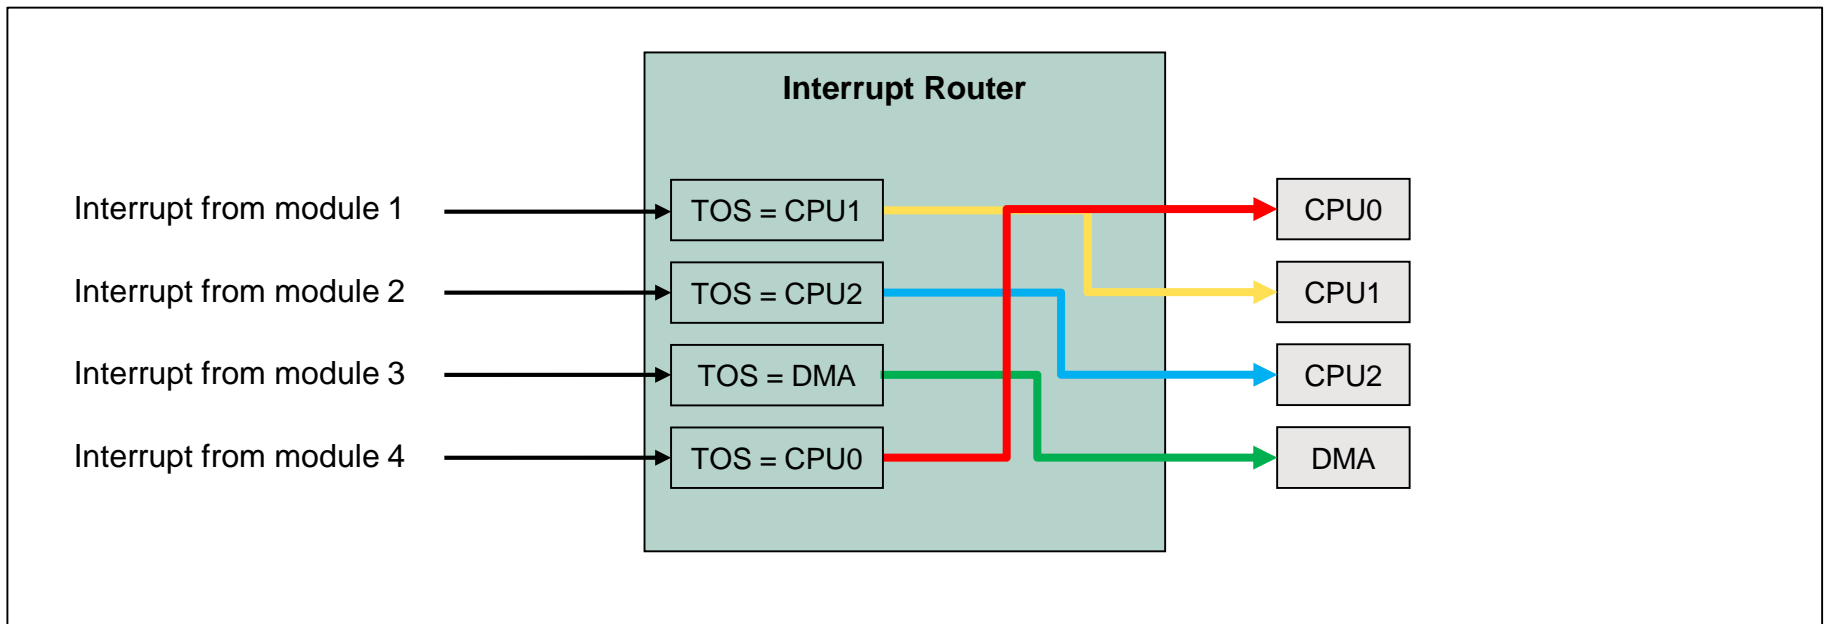

Assign a priority for each Service Request

## Customer Benefits

- > Each interrupt could be configured to triggered one Service Provider (CPUx, DMA)
- > Arbitration for pending Service Requests mapped to the same ISP

# Mapping service requests to service providers

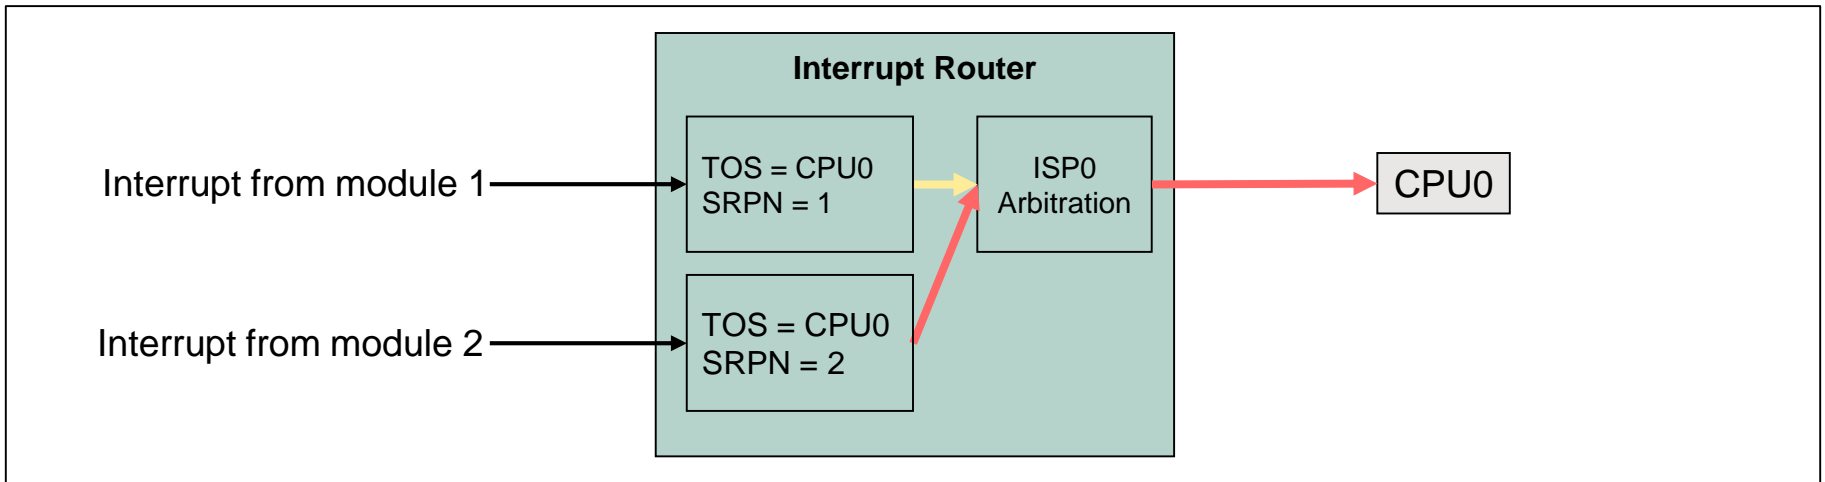

- › Each service request must be configured to be serviced by one of the service provider:
  - Type of Service (TOS)
    - CPU $x$  ( $x=0..2$ ): The service request is executed by the selected CPU
    - DMA: The service request triggers a DMA channel transfer

# IR

## Assign a priority for each service request

- › A Service Request Priority Number (**SRPN**) from 0 to 255 must be assigned to each service request :
  - Depending on the selected Service Provider (TOS) the SRPN presents the following:
    - **CPUx**: The interrupt priority of the related Service request (SRPN 0 is neutral)
    - **DMA**: The number of the DMA channel to be triggered.

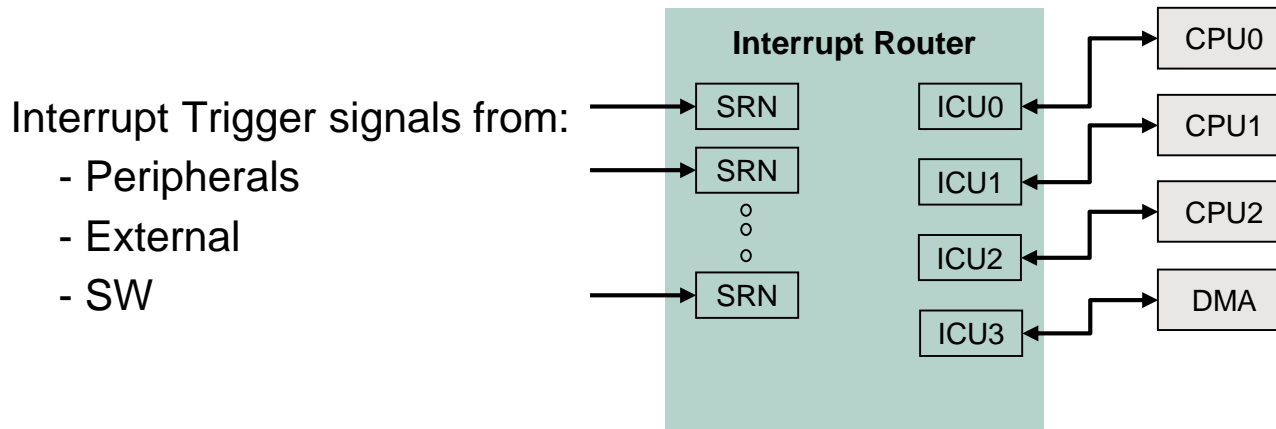

- › **Arbitration**: For each ISP<sub>x</sub>, IR arbitrates among the group of pending Service Requests mapped to this ISP<sub>x</sub>. Winner of an arbitration round is the pending SR with the highest priority (SRPN number).

# IR

## System integration

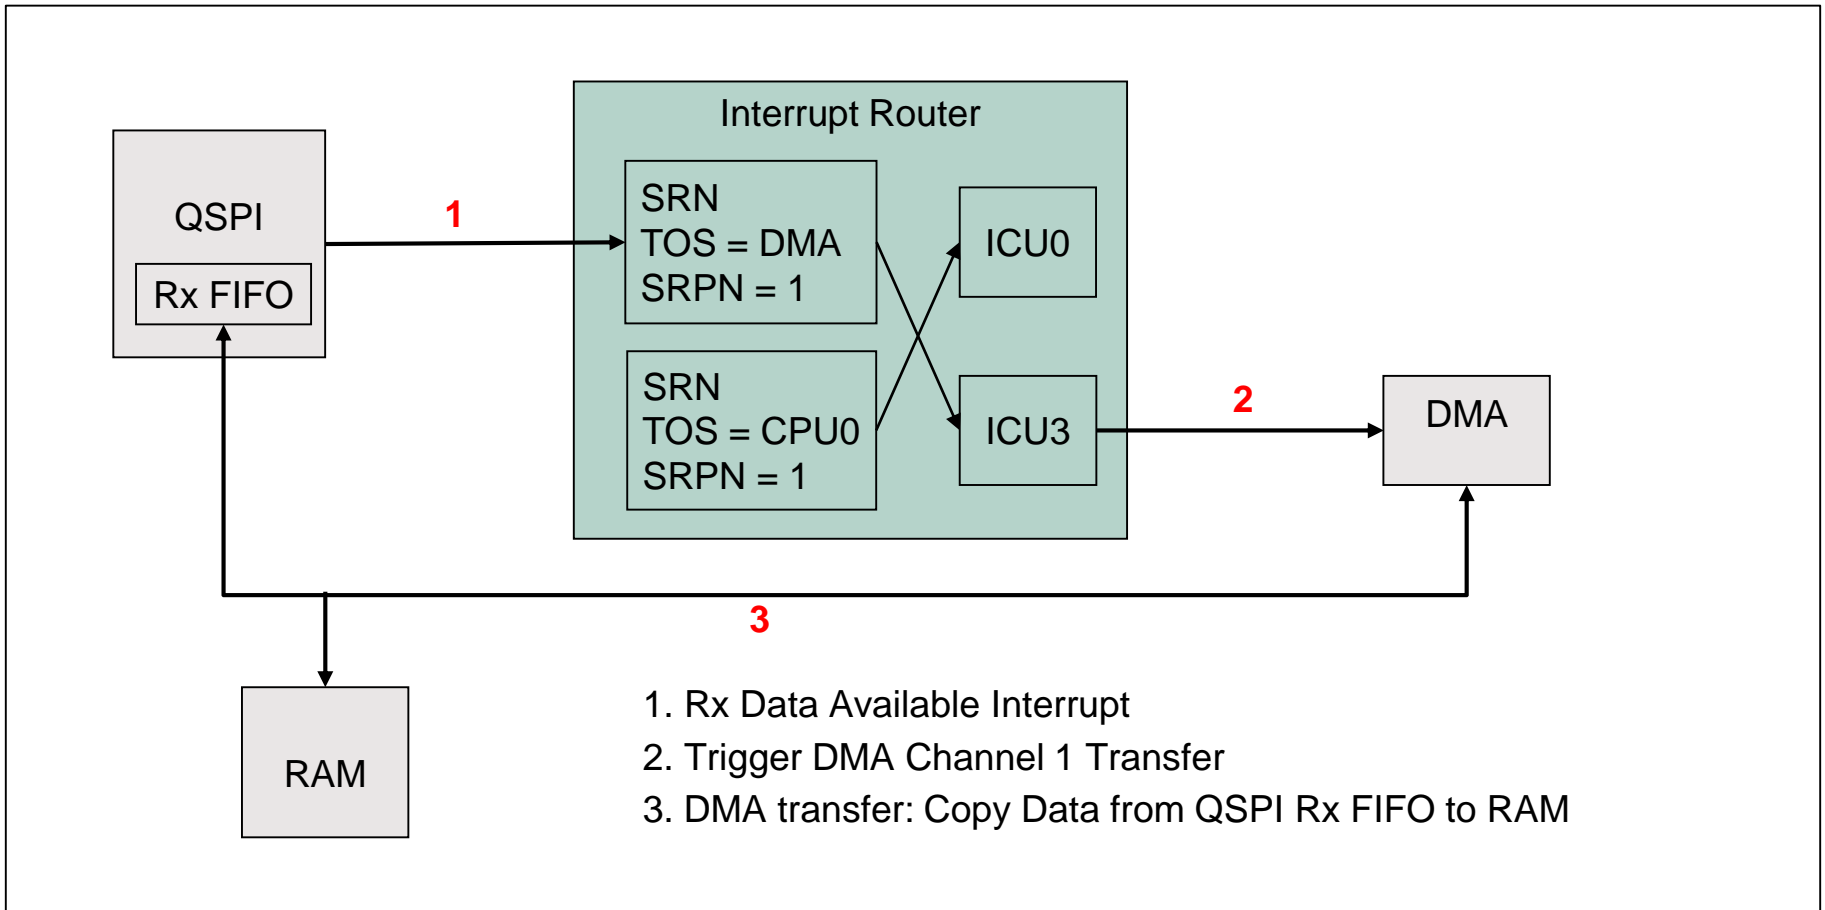

- › Each peripheral interrupt has a dedicated Service Request Node (SRN)
  - TOS and SRPN configuration, Interrupt Overflow, SW Interrupt Set/Clear
- › Each Service Provider has a dedicated Interrupt Control Unit (ICU)
  - Parallel and independant arbitration for pending service requests mapped to different ISPs

# Application example

## DMA transfer

- › In this example data is transferred from the QSPI FIFO registers to internal memory without any CPU intervention
