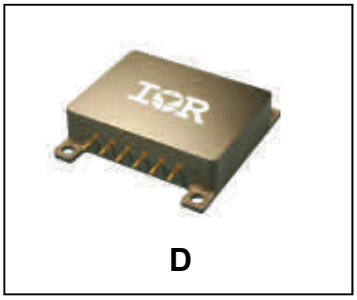
D28XXD-SERIES

HIGH RELIABILITY RADIATION TOLERANT LOW POWER DC-DC CONVERTER

28V Input, Regulated Dual Output



D

Description

The D-Series of DC-DC converters are low power radiation tolerant, high reliability devices designed for hostile radiation environments such as those encountered by geostationary earth orbit satellites, deep space probes and communication systems. Features include small size, high efficiency, low weight, and a good tolerance to total ionizing dose, single event effects, and environmental stresses such as temperature extremes, mechanical shock, and vibration. All components are fully derated to meet the requirements of EEE-INST-002 and MIL-STD-1547B. Extensive documentation including worst case analysis, radiation susceptibility, thermal analysis, stress analysis, and reliability analysis are available.

The D-Series converters have two outputs, each is independently regulated. Two versions exist; One version providing two positive outputs and one version providing one negative and one positive output. The D-Series converters incorporate a fixed frequency fly back power converter and internal EMI filter that meets the requirements for most major satellite power buses. The converters can be remotely turned on and off via an inhibit pin. Additional inhibit pins are also included to control the outputs individually. This feature facilitates turn-on outputs sequencing if desired. Each converter is encased in a cold rolled steel hermetic package. The package measures 1.80"L x 1.40"W x 0.42"H and weighs less than 55 grams. The package utilizes rugged ceramic feed-through copper pins and is hermetically sealed using parallel seam welding. Two package options are available. Please refer to page 9 for I/O configurations.

Environmental screening includes temperature cycling, constant acceleration, fine and gross leak, and burn-in as specified by MIL-PRF-38534 for class H hybrids.

Non-flight versions of the D-Series converters are available for system development purposes. Variations in electrical specifications and screening to meet custom requirements can be accommodated.

Features

- Total Dose Guaranteed to 50 kRad(Si)
- SEE with LET up to 40 MeV·cm^2/mg
- Low Weight < 55 grams
- 18V to 50V DC Input Range
- Up to 10W Output Power
- Independently Regulated Outputs: ±5V, ±12V and ±15V
- –55°C to +125°C Operating Temperature Range
- 100MΩ @ 100VDC Isolation
- Input Under-Voltage Protection
- Meets Conducted Emission Requirements of Most Major Power Buses:
  100Hz -100kHz: 80dBμArms
  100kHz - 10MHz: Log-linear Decrease
  10MHz - 50MHz: 40dBμArms
- Short Circuit and Overload Protection
- Meets the De-rating Requirements of EEE-INST-002 and MIL-STD-1547B
- Synchronization Input / Output
- On/Off Control via Converters' Inhibit Pin and Individual Output's Inhibit Pin
- High CS Damping

Applications

- Launch Vehicles
- Communication Systems
- Geostationary or Low Earth Orbit Satellites

Circuit Description

The D-Series DC-DC converters utilize two-stage regulation with a fly back topology with a switching frequency of 250kHz for primary regulation and linear post regulation in the secondary for each of the outputs

Output power is limited under any load fault condition to approximately 110% of rated output. An overload condition causes the converter output to behave like a constant current source with the output voltage dropping below nominal. The converter will resume normal operation when the load current is reduced below the current limit point.

This protects the converter from both overload and short circuit conditions. There are no latching elements to eliminate the possibility of falsely triggering the protection circuits during single event radiation exposure.

An under-voltage protection circuit prohibits the converter from operating when the line voltage is too low for safe operation. The converter will not start until the line voltage rises to approximately 16V.

An inhibit pin is provided to control converter operation. This inhibit pin is intended for operation with an open collector transistor drive or a relay closure to the input return. The pin may be left open for normal operation and has a nominal open circuit voltage of 4V. Also provided are the individual output on/off control pins (Pin 10-Output 1 Inhibit and Pin 9-Output 2 Inhibit).

Synchronization input pin is included allowing multiple converters to operate at a common switching frequency. Converters can be synchronized to a common frequency with an external clock. This may be used to eliminate beat frequency noise or to avoid generating noise at certain frequencies for noise sensitive systems.

Design Methodology

The D-Series is developed using a proven conservative design methodology, which includes selecting radiation tolerant and established reliability components and fully de rating to the requirements of EEE-INST-002 and MIL-STD-1547B. Heavy de rating of the radiation-hardened power MOSFET virtually eliminates the possibility of SEGR and SEB.

Specifications

Absolute Maximum Ratings		**Recommended Operating Conditions**	
Input Voltage range	-0.5V_{DC} to +60V_{DC}	Input Voltage range (Note 13)	18V_{DC} to 50V_{DC}
Output power	Internally limited	Output power	0 to Max. Rated
Lead Temperature	+300°C for 10 seconds	Operating temperature	-55°C to +125°C
Operating Case temperature (Note 12)	-55°C to +125°C	Operating temperature De-rated (Note 13)	-55°C to +73°C
Storage temperature	-55°C to +135°C

Notes: Specification and Electrical Performance Characteristics

1. Parameter is tested as part of design characterization or after design changes. Thereafter, parameter shall be guaranteed to the limits specified.
2. Parameter verified during line and load regulation tests.
3. Guaranteed for a D.C. to 20MHz bandwidth. Tested using a 20kHz to 10MHz bandwidth.
4. Capacitive load may be any value from 0 to the maximum limit without compromising dc performance. A capacitive load in excess of the maximum limit may interfere with the proper operation of the converter's overload protection, causing erratic behavior during turn-on.
5. Overload power dissipation is defined as the device power dissipation with the load set such that V_{OUT} = 90% of nominal.
6. Load step transition time ≥ 100 µs
7. Recovery time is measured from the initiation of the transient to where V_{OUT} has returned to within ±1% of its steady state value.
8. Line step transition time ≥ 100 µs
9. Turn-on delay time from either a step application of input power or a logic low to a logic high transition on the inhibit pin (pin 6) to the point where V_{OUT} = 90% of nominal.
10 Current limit point expressed as a percentage of full rated load current
11. For models with two positive outputs the envelope specification for the design is that each output voltage is limited to the range 1V to 5V.
12. Although operation at temperatures between +85°C and +125°C is guaranteed, no parameter limits are specified
13 Meets the de-rating requirements of EEE-INST-002 and MIL-STD-1547B – except for ceramic capacitors with voltage stress below 10V will minimum be rated at 50V.
14. End of life is ± 3%

Notes:

① Any Engineering Model (EM) build with the "EM" Suffix shall only be form, fit and functional equivalent to its Flight Model (FM) counterpart, and it may not meet the radiation performance. The EM Model shall not be expected comply with MIL-PRF-38534 flight quality/workmanship standards, and configuration control. An EM build may use electrical equivalent commercial grade components. IR HiRel will provide a list of non-compliance items upon request.

Radiation Performance Characteristics

Test	Conditions	Min	Unit
Total Ionizing Dose (Gamma)*	MIL-STD-883, Method 1019.5 Operating bias applied during exposure, Full Rated Load, V_{IN} = 28V	50	kRads(Si)
