

## Adjustable Low Dropout Positive Voltage Regulator SURFACE MOUNT (SMD-1)

 $V_{ADJ}$ , 3.0A

### Product Summary

Part Number	Output Voltage	Output Current	Package
OM7623NM	Adjustable	3.0A	SMD - 1

### Description

This three terminal positive adjustable voltage regulator is designed to provide 3.0A with higher efficiency than conventional voltage regulators. The device is designed to operate a 1.25V input to output differential and the dropout voltage is specified as a function of load current. The device is pin compatible with older three terminal regulators and is supplied in the easy-to-use hermetic metal SMD - 1 package. This device is ideally suited for Military applications where small size, hermeticity and high reliability are required.

### Features

- Operates Down to 1.0V Dropout @ Max Current
- 0.015% Line Regulation
- 0.01% Load Regulation
- 1% Reference Voltage
- Hermetic SMD - 1 Package

### Absolute Maximum Ratings @ Tc = 25°C

Parameter	Symbol	Value	Units
Output Current	$I_O$	3.0	A
Input Voltage	$V_{IN}$	35	V
Thermal Resistance, Junction to Case	$R_{\theta JC}$	4.1	°C/W
Operating Junction Temperature Range	$T_J$	-55 to + 150	°C
Storage Temperature Range	$T_{STG}$	-55 to + 150	

**Electrical Characteristics @ T<sub>j</sub> = 25°C (Unless Otherwise Specified)**

Parameter	Test Conditions	Min.	Typ.	Max.	Units
Reference Voltage	$I_{OUT} = 10\text{mA}$ , $(V_{IN} - V_{OUT}) = 3.0\text{V}$	1.238	—	1.262	V
	$10\text{mA} \leq I_{OUT} \leq I_{FULL\ LOAD}$ , $1.5\text{V} \leq (V_{IN} - V_{OUT}) \leq 15\text{V}$ ③⑤	1.220	—	1.270	
Line Regulation	$I_{LOAD} = 10\text{mA}$ , $1.5\text{V} \leq (V_{IN} - V_{OUT}) \leq 15\text{V}$ ①②	—	—	0.25	%
Load Regulation	$(V_{IN} - V_{OUT}) = 3.0\text{V}$ , $10\text{mA} \leq I_{OUT} \leq I_{FULL\ LOAD}$ ①②③	—	—	0.9	
		⑤	—	—	1.1
Dropout Voltage	$\Delta V_{REF} = 1\%$ , $I_{OUT} = I_{FULL\ LOAD}$ ④⑤	—	—	1.5	V
Current Limit	$(V_{IN} - V_{OUT}) = 5.0\text{V}$ ⑤	3.0	—	—	A
	$(V_{IN} - V_{OUT}) = 15\text{V}$ ⑤	0.2	—	—	
Minimum Load Current	$(V_{IN} - V_{OUT}) = 15\text{V}$ ⑤	—	—	10	mA
Thermal Regulation	30ms Pulse Width (Guaranteed by design)	—	—	0.02	%W
Ripple Rejection	$f = 120\text{Hz}$ , $C_{Adj} = 10\mu\text{F}$ Tantalum $I_{OUT} = I_{FULL\ LOAD}$ $(V_{IN} - V_{OUT}) = 3.0\text{V}$	60	—	—	dB
Adjust Pin Current	$I_{LOAD} = 10\text{mA}$ , $(V_{IN} - V_{OUT}) = 15\text{V}$	—	—	80	$\mu\text{A}$
Adjust Pin Current Change	$10\text{mA} \leq I_{OUT} \leq I_{FULL\ LOAD}$ $1.5\text{V} \leq (V_{IN} - V_{OUT}) \leq 15\text{V}$ ⑤	—	—	5.0	
Temperature Stability	$-55^\circ\text{C} \leq T_J \leq +150^\circ\text{C}$	—	—	1.5	%
Long Term Stability	$T_J = 125^\circ\text{C}$ , $t = 1000\text{hrs}$	—	—	1.0	

**Notes:**

- ① Load and line regulation are measured at a constant junction temperature by low duty cycle pulse testing.
- ② Line and load regulation are guaranteed up to the maximum power dissipation. Power dissipation is determined by the input/output differential voltage and output current. Guaranteed maximum power dissipation will not be available over the full input/output voltage range.
- ③ I FULL LOAD curve is defined as the minimum value of current limit as a function of input to output voltage. Note that power dissipation is only achievable over a limited range of input to output voltage.
- ④ Dropout voltage is specified over the full output current range of the device.
- ⑤ Specification applies over full operating temperature range.

**Application Notes:**

**Stability**

The OM7623nm Series requires the use of an output capacitor as part of the device frequency compensation. For all operating conditions, the addition of 150µF aluminum electrolytic or a 22µF solid tantalum on the output will ensure stability. Normally, capacitors much smaller than this can be used. Many different types of capacitors with widely varying characteristics are available. These capacitors differ in capacitor tolerance (sometimes ranging up to ±100%), equivalent series resistance, and capacitance temperature coefficient. The 150µF or 22µF values given will ensure stability.

When the adjustment terminal is bypassed to improve the ripple rejection, the requirement for an output capacitor increases. The values of 22µF tantalum or 150µF aluminum cover all cases of bypassing the adjustment terminal. Without bypassing the adjustment terminal, smaller capacitors can be used with equally good results and the table below shows approximately what size capacitors are needed to ensure stability.

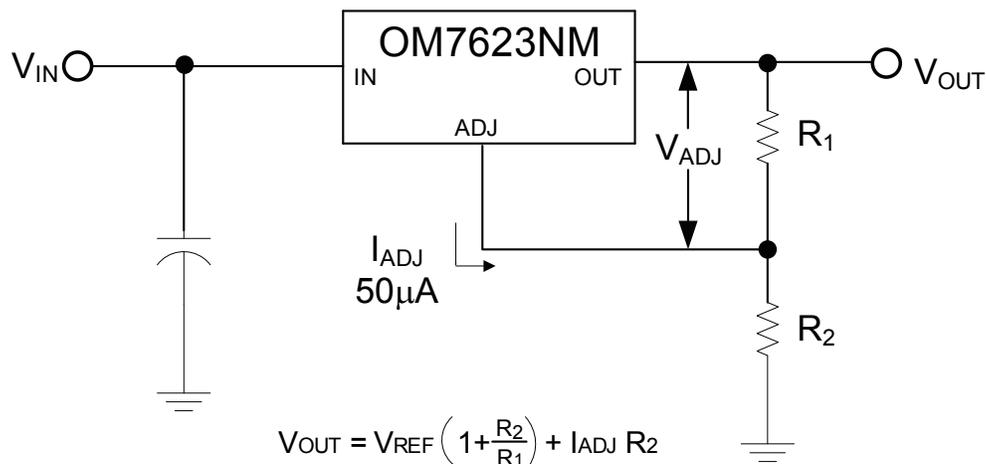

Normally, capacitor values on the order of 100µF are used in the output of many regulators to ensure good transient response with heavy load current changes. Output capacitance can be increased without limit and larger values of output capacitor further improve stability and transient response of the regulators.

**Recommended Capacitor Values**

Input	Output	Adjustment
10µF	10µF Tantalum, 50µF Aluminum	None
10µF	22µF Tantalum, 150µF Aluminum	20µF

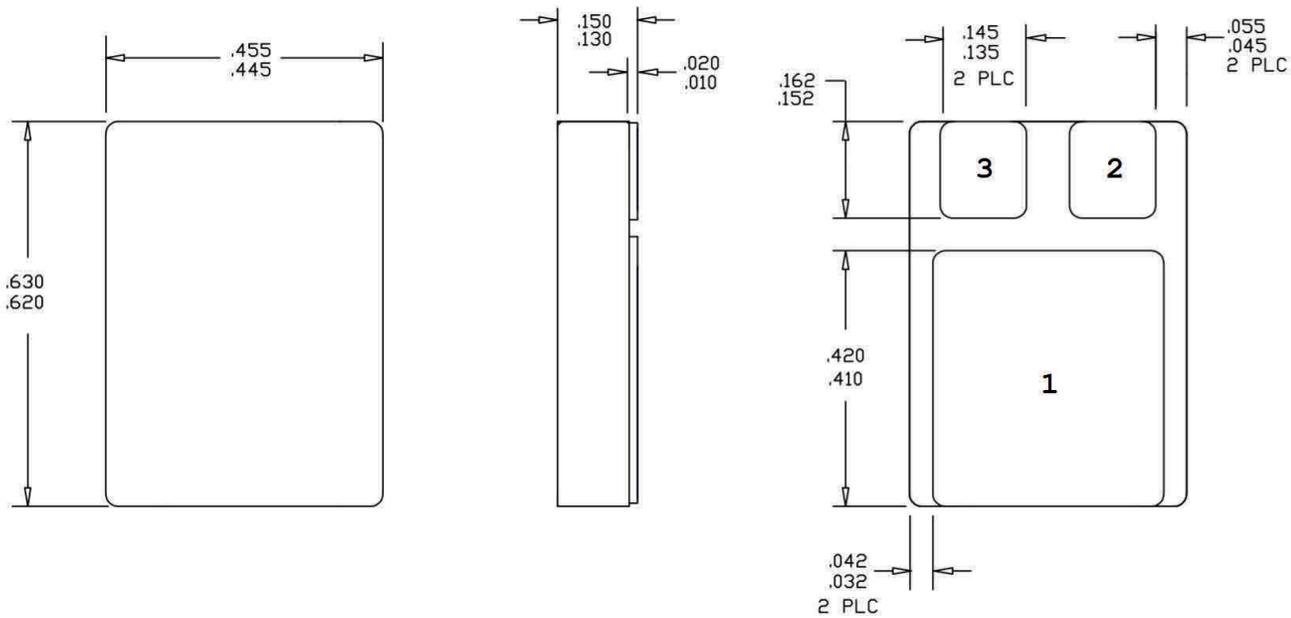

**Output Voltage - Adjustable Regulators**

The OM7623NM devices develop a 1.25V reference voltage between the output and the adjust terminal (see Fig 4). By placing a resistor, R1 between these two terminals, a constant current is caused to flow through R1 and down through R2 to set the overall output voltage. Normally this current is the specified minimum load current of 10mA. Because I<sub>ADJ</sub> is very small and constant when compared with the current through R1, it represents a small error and can usually be
